7. Design Guidance

7.1. Application Guide Circuit

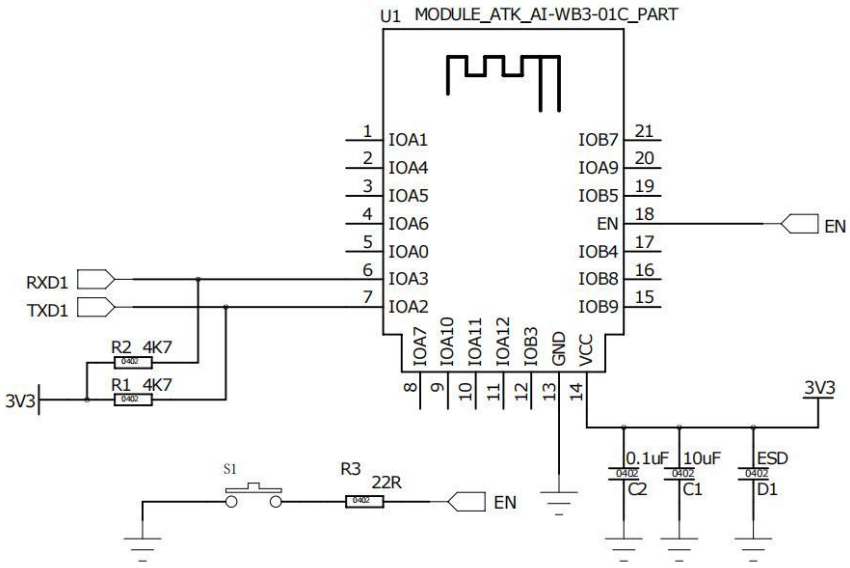

Figure 10 Application circuit diagram

- If the IO port is used as PWM, it is recommended to reserve a 4.7K pull-down resistor around the module. Especially in the application of light control, it can prevent the phenomenon of flashing lights at the moment of power-on and start-up.

7.2. Recommend PCB footprint size

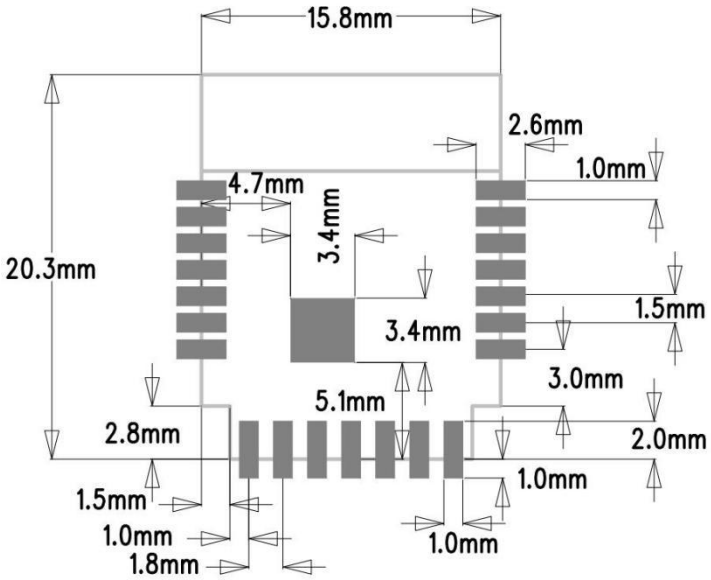

Figure 11 Recommend PCB footprint size(unit:mm)

7.3. Antenna layout requirements

- For the installation position on the motherboard, the following two methods are recommended:

Solution 1: Put the module on the edge of the motherboard, and the antenna area extends out of the edge of the motherboard.

Solution 2: Put the module on the edge of the motherboard, and hollow out an area on the edge of the motherboard where the antenna is.

- In order to meet the performance of the on-board antenna, it is forbidden to place metal parts around the antenna and keep away from high-frequency devices.

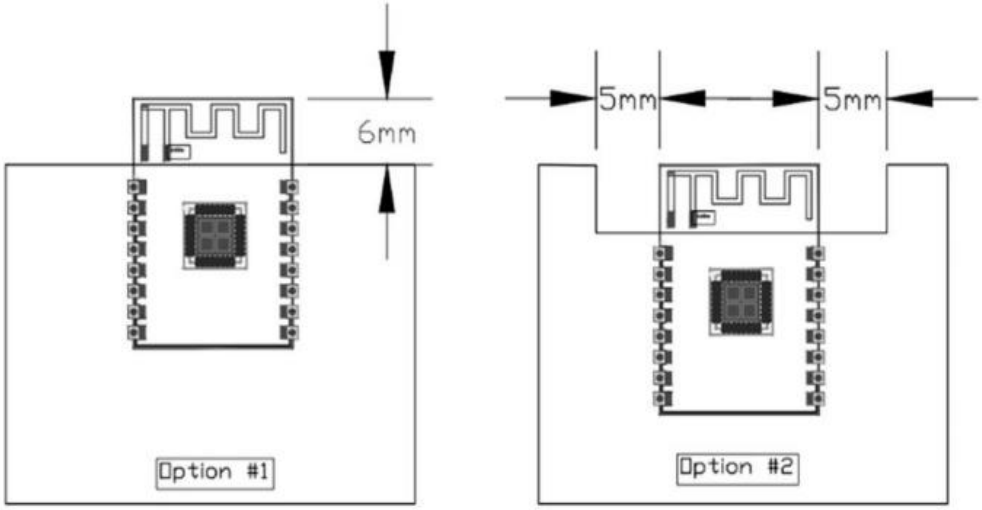

Figure 12 Antenna layout diagram

7.4. Power supply

- Recommend 3.3V voltage, peak current above 500mA.
- It is recommended to use LDO power supply; if using DC-DC, it is recommended to control the ripple within 30mV.
- It is recommended to reserve the position of the dynamic response capacitor for the DC-DC power supply circuit, which can optimize the output ripple when the load changes greatly.
- It is recommended to add ESD devices to the 3.3V power interface

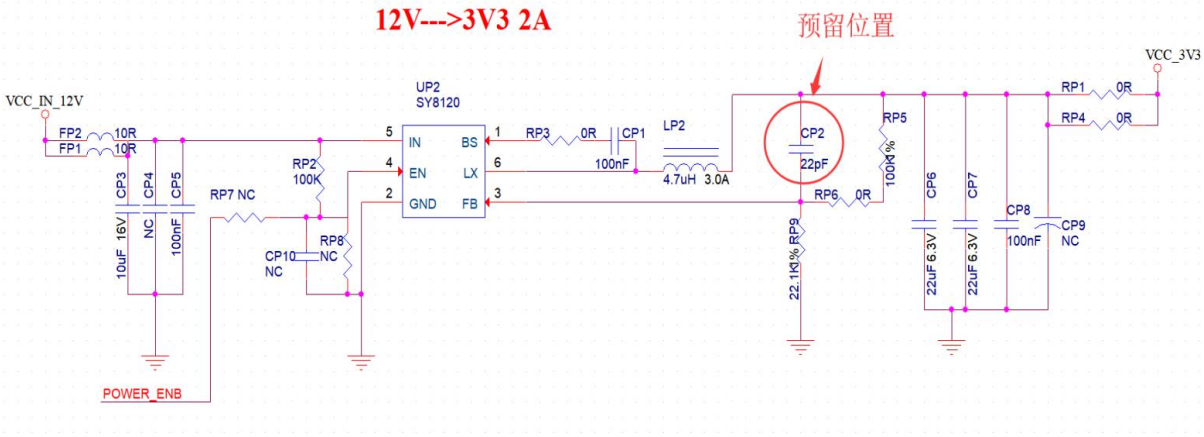

Figure 13 DC-DC step-down circuit diagram

7.5. GPIO

- There are some IO ports on the periphery of the module. If you need to use it, it is recommended to connect a 10-100 ohm resistor in series with the IO ports. This can suppress overshoot and make the levels on both sides more stable. Helpful for both EMI and ESD.
- For the pull-up and pull-down of the special IO port, please refer to the instructions in the specification, which will affect the startup configuration of the module.
- The IO port of the module is 3.3V. If the level of the main control and the IO port of the module do not match, a level conversion circuit needs to be added.
- If the IO port is directly connected to the peripheral interface, or terminals such as pin headers, it is recommended to reserve an ESD device near the IO port wiring near the terminal.

8. Storage conditions

Products sealed in moisture-proof bags should be stored in a non-condensing atmosphere at <40° C/90%RH.

The moisture sensitivity level MSL of the module is 3.

After the vacuum bag is unpacked, it must be used within 168 hours at 25±5° C/60%RH, otherwise it needs to be baked before it can be put online again.
